Understanding how catalysts work helps in industrial processes and biological systems.

Common Questions and Answers from Chapter 18

Here are some typical problems and their solutions from Pearson Chemistry Chapter 18, based on the answer key.

Question 1: How does temperature affect reaction rate?

Answer: According to the Arrhenius equation, an increase in temperature results in a higher reaction rate. This is because higher temperatures provide reactant molecules with more kinetic energy, increasing the frequency of effective collisions. For example, a 10°C rise typically doubles the reaction rate, though this varies depending on the reaction.

Question 2: Derive the rate law for a reaction with the following mechanism:

- Step 1: $A + B \rightarrow C$ (slow)
- Step 2: $C + D \rightarrow E$ (fast)

Answer: Since the first step is slow, it is the rate-determining step. The rate law is:

$$\text{Rate} = k [A][B]$$

Because the second step is fast, it does not affect the overall rate. The overall reaction rate depends on the concentrations of A and B, as indicated.

Question 3: What is the effect of a catalyst on the activation energy?

Answer: Catalysts lower the activation energy (E_a) of a reaction. By providing an alternative pathway with a lower E_a , catalysts increase the reaction rate without being consumed in the process.

Question 4: How do you determine the reaction order from experimental data?

Answer: Reaction order can be determined by analyzing the concentration vs. time data and using methods such as:

- The method of initial rates
- Integrated rate laws

- Graphical methods (e.g., plotting $1/[A]$ vs. time for second-order reactions)

The slope and intercepts from these plots help determine the reaction order and rate constant.
