Steps to Generate a Mohr Circle in MATLAB

Creating a Mohr circle in MATLAB involves a series of steps, from defining the stress components to plotting the circle with appropriate annotations.

1. Define the Stress Components

Begin by specifying the normal stresses (σ_x , σ_y) and shear stress (τ_{xy}) acting on the element.

```
```matlab
```

```
sigma_x = 50; % Normal stress in MPa
```

```
sigma_y = 20; % Normal stress in MPa
```

```
tau_xy = 15; % Shear stress in MPa
```

```
```
```

2. Calculate the Center and Radius of the Mohr Circle

The center (C) and radius (R) of the circle are derived from the stress components:

$$C = \frac{\sigma_x + \sigma_y}{2}$$

$$R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$\sigma_{1,2} = C \pm R$$

$$\tau_{1,2} = \pm \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

]

``matlab

$$C = (\sigma_x + \sigma_y) / 2;$$

$$R = \sqrt{((\sigma_x - \sigma_y)/2)^2 + \tau_{xy}^2};$$

...

3. Define the Angle Range for Plotting

Choose a range of angles (θ) over which to plot the circle, typically from 0 to 180 degrees.

``matlab

$$\theta_{deg} = \text{linspace}(0, 180, 360);$$

$$\theta_{rad} = \text{deg2rad}(\theta_{deg});$$

...

4. Calculate the Stress Transformation Points

Using the stress transformation equations, compute the normal (σ_θ) and shear stresses (τ_θ) for each rotation angle:

[

$$\sigma_\theta = C + R \cos(2\theta)$$

]

[

$$\tau_\theta = R \sin(2\theta)$$

]

```
```matlab
```

```
sigma_theta = C + R cos(2 theta_rad);
```

```
tau_theta = R sin(2 theta_rad);
```

```
```
```

5. Plot the Mohr Circle

Use MATLAB's plotting functions to visualize the circle and stress points.

```
```matlab
```

```
figure;
```

```
circle_x = C + R cos(theta_rad);
```

```
circle_y = R sin(theta_rad);
```

```
plot(circle_x, circle_y, 'b', 'LineWidth', 2);
```

```
hold on;
```

```
% Plot the center point
```

```
plot(C, 0, 'ro', 'MarkerSize', 8, 'MarkerFaceColor', 'r');
```

```
% Plot the principal stresses
```

```
sigma_1 = C + R; % Max principal stress
```

```
sigma_2 = C - R; % Min principal stress
```

```
plot([sigma_1, sigma_2], [0, 0], 'ks', 'MarkerSize', 8, 'MarkerFaceColor', 'k');
```

```
% Add labels and title
```

```
xlabel('Normal Stress \sigma (MPa)');
```

```
ylabel('Shear Stress \tau (MPa)');
```

```
title('Mohr Circle in MATLAB');
```

```
grid on;
```

```
axis equal;
```

```
...
```

\[

$$\tau_{\max} = \frac{\sigma_1 - \sigma_2}{2}$$

\]

which is visually represented as the radius of the Mohr circle.

4. Plotting the Mohr Circle

- Center of the circle: $\frac{\sigma_x + \sigma_y}{2}$.
- Radius: $\tau_{\max}$.
- Use MATLAB's `rectangle` function with 'Curvature' set to [1, 1] to draw circles or `viscircles` from the Image Processing Toolbox.

Sample MATLAB code snippet:

```
``matlab

% Input stress components

sigma_x = 50; % MPa

sigma_y = 20; % MPa

tau_xy = 10; % MPa

% Calculate principal stresses

sigma_avg = (sigma_x + sigma_y) / 2;

diff_sigma = (sigma_x - sigma_y) / 2;

sigma_1 = sigma_avg + sqrt(diff_sigma^2 + tau_xy^2);

sigma_2 = sigma_avg - sqrt(diff_sigma^2 + tau_xy^2);

% Calculate maximum shear stress
```

```
tau_max = sqrt(diff_sigma^2 + tau_xy^2);

% Plot Mohr Circle

theta = linspace(0, 2pi, 100);

x_center = sigma_avg;

r = tau_max;

x = x_center + r cos(theta);

y = r sin(theta);

figure;

plot(x, y, 'b', 'LineWidth', 2);

hold on;

plot([sigma_x, sigma_y], [tau_xy, -tau_xy], 'ro');

xlabel('Normal Stress (MPa)');

ylabel('Shear Stress (MPa)');

title('Mohr Circle');

grid on;

axis equal;

...
```

Fundamental Concepts in Mechanics of Materials

Stress and Strain

Understanding how materials respond to external forces begins with grasping the concepts of stress and strain:

- Stress: The internal force per unit area within a material, typically expressed in units of Pascals (Pa). It can be categorized as normal or shear stress.
- Strain: The deformation or displacement experienced by a material relative to its original size or shape, usually expressed as a dimensionless ratio or percentage.

Types of Stress and Strain

- Normal stress and strain: Result from axial loads causing stretching or compression.
- Shear stress and strain: Result from forces applied parallel to a surface, causing deformation like twisting or sliding.

Material Behavior

Materials exhibit different behaviors under load:

- Elastic: Deformation is reversible upon removal of load.
- Plastic: Deformation is permanent.
- Fracture: Material failure occurs after exceeding certain stress or strain limits.

Axial Loading and Deformation

Axial Stress and Strain

When a member is subjected to axial load (tensile or compressive), the resulting stress and strain are calculated as:

- Normal stress $(\sigma) = \left(\frac{P}{A} \right)$
- Normal strain $(\epsilon) = \left(\frac{\Delta L}{L_0} \right)$

where:

- (P) = axial load
- (A) = cross-sectional area
- (ΔL) = change in length
- (L_0) = original length

Axial Deformation Analysis

- Determine the stress distribution across the member.
- Use Hooke's law (for elastic deformation): $(\sigma = E \epsilon)$, where (E) is the modulus of elasticity.
- Calculate elongation or compression based on applied loads.

Torsion of Shafts

Torsional Stress and Strain

Torsion involves twisting a member about its longitudinal axis, inducing shear stresses:

- Shear stress $(\tau) = \left(\frac{T r}{J} \right)$

where:

- (T) = applied torque
- (r) = radius at the point of interest
- (J) = polar moment of inertia

Torsion in Circular Shafts

- Torsion causes shear stress varying linearly from zero at the center to maximum at the outer surface.
- The angle of twist (θ) can be calculated for a given torque and shaft dimensions.

Torsional Deformation

- Use the shear strain formula: $\gamma = \frac{r \theta}{L}$
- Ensure the material's shear strength is not exceeded to prevent failure.

Bending of Beams

Bending Moments and Normal Stresses

When a beam is subjected to bending loads:

- Bending induces normal stresses across the cross-section.
- The maximum bending stress occurs at the outermost fibers: $\sigma_b = \frac{M y}{I}$

where:

- M = bending moment
- y = distance from neutral axis
- I = moment of inertia

Beam Deflection

- Calculated using methods such as double integration, Macaulay's method, or energy methods.
- Important for ensuring structural integrity and serviceability.

Section Properties

- The shape and size of the beam's cross-section significantly influence its ability to resist bending.
- Common shapes: rectangular, I-beam, circular, and T-section.

Transverse Shear in Beams

Shear Force and Shear Stress

- Shear force (V) varies along the length of the beam.
- Transverse shear stress (τ) at a point is calculated as:

$$\tau = \frac{VQ}{It}$$

where:

- Q = first moment of area
- t = thickness at the point

Shear Stress Distribution

- Shear stress varies across the cross-section, often highest at the neutral axis.

Combined Loading and Stress Analysis

Superposition of Stresses

Structures often experience multiple types of loads simultaneously:

- Axial + bending
- Axial + torsion
- Bending + shear

Mohr's Circle

- A graphical method for determining principal stresses and maximum shear stresses at a point.

Failure Theories

To predict failure under combined loads, various theories are used:

- Maximum normal stress theory

- Maximum shear stress theory (Tresca)
- Maximum distortion energy theory (von Mises)

Column Buckling and Stability

Euler's Buckling Theory

- Columns under compression can buckle if slenderness ratio exceeds a critical value.
- Critical load:

$$P_{cr} = \frac{\pi^2 E I}{(K L)^2}$$

where:

- $(K L)$ = effective length factor depending on boundary conditions
- (L) = actual length of the column

Factors Affecting Buckling

- Material properties
- Cross-sectional shape
- End conditions

Energy Methods in Mechanics of Materials

Strain Energy

- The energy stored in a member due to deformation.
- Useful for analyzing complex loadings and stability.

Castigliano's Theorem

- Determines deflections and rotations by differentiating strain energy with respect to applied forces or moments.

Stress Concentrations and Failure Criteria

Stress Concentration Factors

- Localized increase in stress due to geometric discontinuities like holes, notches, or abrupt changes in cross-section.

Failure Theories

- Critical for designing safe components.
- Common failure theories include:
 - Maximum normal stress (Rankine)
 - Maximum shear stress (Tresca)
 - von Mises criterion
