The upper respiratory tract includes structures responsible for filtering, warming, and humidifying inspired air.

- **Nasal Cavity:** The main passageway for air entering the respiratory system, lined with mucous membranes and tiny hairs called cilia.
- **Sinuses:** Air-filled cavities (maxillary, frontal, ethmoid, sphenoid) that lighten the skull and produce mucus.
- **Pharynx:** Also known as the throat, it connects nasal cavity to the larynx and esophagus, serving both respiratory and digestive functions.
- **Larynx:** The voice box, located below the pharynx; houses the vocal cords and is crucial for phonation.

Lower Respiratory Tract

The lower respiratory tract handles the main functions of gas exchange and includes:

- **Trachea:** The windpipe, a tube reinforced with cartilage rings that conducts air from the larynx to the bronchi.
- **Bronchi:** Two main branches (primary bronchi) that lead into each lung, further dividing into

secondary and tertiary bronchi.

Labeling the Respiratory System: Key Answers and Descriptions

Mastering the labels involves not just recognizing structures but understanding their functions. Below are essential label answers with detailed descriptions.

Nasal Cavity

The nasal cavity is a large air-filled space above and behind the nose in the middle of the face. It filters, warms, and moistens incoming air through mucous membranes and cilia. It also contains sensory receptors for smell.

Sinuses

Sinuses are air-filled chambers within the skull bones that connect to the nasal cavity. They reduce skull weight and produce mucus that drains into the nasal passages.

Pharynx

A muscular tube about 13 centimeters long, the pharynx connects the nasal cavity and mouth to the larynx and esophagus, serving as a passageway for air and food.

Larynx

The larynx, or voice box, contains vocal cords and is responsible for sound production. It also protects the trachea during swallowing.

Trachea

A flexible tube about 12 centimeters long, reinforced with cartilage rings to prevent collapse. It conducts air to the bronchi.

Bronchi and Bronchioles

The primary bronchi branch off the trachea into each lung. They further divide into secondary and tertiary bronchi, then into bronchioles, which lead to alveoli.

Alveoli

Microscopic air sacs with thin walls where oxygen diffuses into blood and carbon dioxide diffuses out. Their large surface area makes gas exchange efficient.

Lungs

Spongy organs that contain alveoli; they expand and contract during breathing, facilitating oxygen intake.

Common Labeling Activities and Practice Tips

To become proficient in respiratory system labeling, practice is key. Here are some effective strategies:

- **Use Diagrams:** Regularly label blank diagrams to reinforce memory.
