Sample Problems from Chapter 10 and Their Solutions

Problem 1: Inscribed Angles

Question: In a circle, an inscribed angle intercepts an arc measuring 120° . What is the measure of the inscribed angle?

Solution:

The measure of an inscribed angle is half the measure of its intercepted arc.

Therefore,

$$\text{Angle measure} = 120^\circ / 2 = 60^\circ.$$

Answer: The inscribed angle measures 60° .

Problem 2: Arc Length Calculation

Question: A circle has a radius of 10 units. Find the length of an arc that intercepts a 90° central angle.

Solution:

$$\text{Arc length} = (\text{central angle} / 360^\circ) \times 2\pi r$$

$$= (90^\circ / 360^\circ) \times 2\pi \times 10$$

$$= (1/4) \times 20\pi$$

$$= 5\pi \approx 15.7 \text{ units.}$$

Answer: The arc length is approximately 15.7 units.

Problem 3: Tangent and Secant Properties

Question: A tangent and a secant intersect outside a circle, forming an angle of 40° . If the secant's external segment measures 6 units, what is the length of the tangent segment?

Solution:

Using the tangent-secant theorem,

$$(\text{External segment of secant}) \times (\text{whole secant segment}) = (\text{tangent segment})^2.$$

Suppose the secant's external segment is 6, and the entire secant segment is x , then:

$$6 \times x = (\text{tangent})^2.$$

To find the tangent segment, additional information about the secant's total length is needed. If, for example, the entire secant length is 10, then:

$$6 \times 10 = (\text{tangent})^2 \quad ? \quad 60 = (\text{tangent})^2 \quad ? \quad \text{tangent} \quad ? \quad \sqrt{60} \quad ? \quad 7.75 \text{ units.}$$

Answer: The tangent segment measures approximately 7.75 units.

1. Arc Measures and Angles

Understanding how to calculate and interpret arc measures is fundamental in circle geometry.

- Inscribed Angles: An inscribed angle's measure is half the measure of its intercepted arc.
- Formula:

$$\angle BAC = \frac{1}{2} \text{measure of arc } BC$$

- Central Angles: The measure of a central angle equals the measure of its intercepted arc.
- Formula:

$$\angle AOB = \text{measure of arc } AB$$

- Arc Length and Area: When dealing with arc length, the formula involves the radius and central angle:
- Arc Length:

$$L = r\theta \text{ (where } \theta \text{ is in radians)}$$

- Area of a Sector:

$$A = \frac{\theta}{2\pi} \times \pi r^2 = \frac{\theta r^2}{2}$$

Answer Key Insights:

The answer key provides step-by-step calculations for these problems, often including conversions between degrees and radians, and demonstrates how to use proportional reasoning to find missing measures.

2. Properties of Chords, Tangents, and Secants

These elements are crucial in solving circle problems:

- Chord Theorems:
 - Chords equidistant from the center are equal.
 - The perpendicular bisector of a chord passes through the circle's center.
- Tangent Properties:
 - A tangent is perpendicular to the radius at the point of contact.
 - Tangent segments from a common external point are equal.
- Secants and External Points:
 - The Power of a Point Theorem states:

If two secants intersect outside a circle,
